

## Additional Remarks on Ranunculaceae in Taiwan (6) —Some genera in Taiwan.

T. Y. Aleck Yang<sup>(1, 3)</sup> and Tseng-Chieng Huang<sup>(2)</sup>

(Manuscript received 13 February 1996; accepted 9 March 1996)

**ABSTRACT :** This is a taxonomic study of some genera of Ranunculaceae in Taiwan, including *Aconitum* L., *Anemone* L., *Calathodes* Hook.f. & Thomson, *Coptis* Salisb., *Dichocarpum* W. T. Wang & Hsiao, *Ranunculus* L. and *Trollius* L. Two taxa of *Aconitum* are recognized in Taiwan; *Eriocapitella* is a synonym of *Anemone*; the concept of the genus *Dichocarpum* to replace the genus *Isopyrum* in Taiwan is accepted; *Ranunculus cantoniensis* is recognised as the most common species in Taiwan; brief notes are provided for species of *Calathodes*, *Coptis* and *Trollius*. A key to taxa, distribution maps and taxonomic descriptions are also provided.

**KEY WORDS:** *Aconitum*, *Anemone*, *Calathodes*, *Coptis*, *Dichocarpum*, *Ranunculus*, *Trollius*, Taxonomy, Ranunculaceae, Taiwan.

### INTRODUCTION

Some genera of Ranunculaceae with confined distribution in Taiwan, i.e. *Anemone*, *Calathodes*, *Dichocarpum* and *Trollius* were studied during the last twenty years (Fu, 1988; Hsiao and Wang, 1964; Hsiao, 1979; Wang, 1979, 1980). However, some nomenclatural problems, e.g. *Anemone vitifolia* versus *Eriocapitella vitifolia* or confused taxa, *Aconitum* and *Ranunculus* (Liu and Hsieh, 1976) were reviewed. For this study, the fresh materials preserved in 70% ethanol and dried herbarium specimens were investigated. A key to the taxa of each genus, distribution maps and taxonomic descriptions are provided; the number of species in each genus follows Mabberley (1987).

### 1. ACONITUM L. 烏頭屬

Perennial or annual erect or scandent herbs with underground tubers. Leaves simple, alternate or sometimes radical, palmately divided, usually 3 to 5-partite or more, rarely undivided; petiolate. Inflorescence a raceme or panicle; bracts usually 2. Flowers bisexual, zygomorphic, violet, purple, blue, yellow or sometimes cream-colored, composed an upper sepal, two lateral sepals, two lower sepals and two (-five) petals (nectaries) per flower. Sepals 5, petaloid, upper sepals galeate or boat-shaped, lateral sepals round or nearly so,

  3. Corresponding author.

lower sepals elliptic, smaller than others; petals 2, sometimes 5, small, lobed usually with labia and spur, nectariferous, stalked; stamens numerous, spirally arranged, anthers elliptic-globose, filaments winged at base; staminodes present or absent; carpels 3—5 (-6—13), free, styles shorter than ovaries, persistent after anthesis. Follicles ellipsoid, short. Seeds 10—20, quadrangular, winged along the ridges or sometimes with membranous wings on the surface.

About 300 species in temperate regions of the Northern Hemisphere, mainly distributed in Asia, next in Europe and North America; 167 species in mainland China; only one species (with 2 taxa) in Taiwan.

### Key to the species

1. Plants erect; distributed at altitudes of 1800-3600 m ..... 1a. *A. fukutomei* var. *fukutomei*
1. Plants scandent; distributed at altitudes of 1700-2400 m ..... 1b. *A. fukutomei* var. *formosanum*

**1. Aconitum fukutomei** Hayata, Icon. Pl. Form. 4:1. 1914; Sasaki, List Pl. Form. 182. 1928; Yamamoto in Trans. Nat. Hist. Soc. Form. 20: 100. 1930; Kudo & Masamune in Ann. Rep. Taihoku Bot. Gard. 2: 75. 1932; Suzuki, Short Fl. Form. 64. 1936; Masamune, List Vasc. Pl. Taiwan 52. 1954; Tamura in Acta Phytotax. Geobot. 18: 64. 1959.  
Type: Mt. Kiraishuzan, K. Fukutome s. n. Oct. 1913 (TI).

臺灣烏頭

*Aconitum bartlettii* var. *fukutomei* (Hayata) Liu & Hsieh, Fl. Taiwan 2: 478. 1976; syn. nov.  
*Aconitum bartlettii* Yamam. in Trans. Nat. Hist. Soc. Form. 20: 98. 1930; syn. nov. Type: Taiwan: Hualien: In monte Noko (Mt. Nengkaoshan), 2876-3109 m, type of fruits, H.H. Bartlett 6225 (lectotype is designated here; TAI!), 2713 m, type of flowers, S. Sasaki s.n. Aug 1929 (syntype: TAI!).  
*Aconitum yamamotoanum* Ohwi in Fedd. Rep. Sp. Nov. 36: 49. 1934. Type: Mt. Tapachienshan (Miaoli) to Mt. Hsueshan (Taichung), K. Kojima s.n. Aug 1933 (holotype: KYO!).  
*Aconitum kojimae* Ohwi ex Tamura in Acta Phytotax. Geobot. 18: 64. 1959. Type: Formosa: Takao (Kaohsiung): Kwanzangoe (Kuanshanyuei), K. Kojima s.n. Aug 1933 (holotype: KYO!), summit of Mt. Kwanzan, S. Okamoto s.n. Oct 1937 (paratype: KYO!); Rokki (Liukuei), Mt. Pinanshu (Mt. Peinanchushan), S. Okamoto s.n. Sept 1937 (paratypes: KYO!).  
*Aconitum kojimae* var. *ramosum* Tamura in Acta Phytotax. Geobot. 18: 65. 1959. Type: Formosa: Takao (Kaohsiung): Mt. Kwanzan (Mt. Kuanshan), S. Okamoto s.n. Oct 1937 (holotype: KYO!).

Perennial erect herbs, 15—150 cm tall, pubescent or glabrous at maturity. Leaves simple, (4.5-)5.4—11.8(-13.5) cm long, (7.5-)8.4—15.6(-17.4) cm wide, palmately divided, usually 5-partite, pubescent on both surfaces or sparsely velutinous on adaxial surface; margin lacerate; apex acuminate; base cordate; petioles 3.3 — 12.5 cm long, pubescent. Inflorescence a raceme or sometimes flowers solitary; pedicels pubescent; bracts 2. Flowers violet or mixed with white. Sepals 5, pubescent outside, sparsely velutinous or glabrous inside; upper sepals galeate, 1.2 — 2.5 cm long; lateral sepals round, lower sepals elliptic. Petals 0.8—1.5 cm long, sparsely velutinous; spurs curved backward; nectariferous at base. Stamens numerous; filaments winged at base, sparsely velutinous or glabrous. Carpels 3—5, fusiform, sparsely velutinous or glabrous; styles 4 mm long. Follicles 2—4, 0.9—2.4 cm long, sessile, glabrous or subglabrous; seeds many, with membranous wings on the surface.

Flowering July to September; fruiting August to November (-December).

Endemic; in woods and on slopes at over 2500 m in the central mountains (Fig. 1).

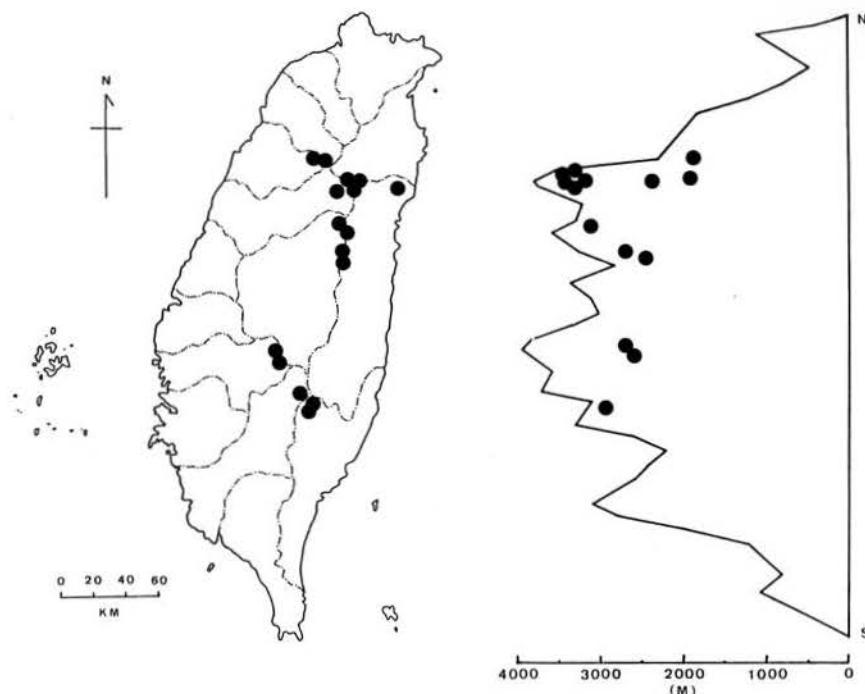

Fig. 1. Latitudinal and altitudinal distribution of *Aconitum fukutomei* var. *fukutomei*.

蔓烏頭

Perennial scandent herbs, pubescent. Leaves simple, (5.3-)6.6—10.1(-10.5) cm long, (8.4-)9.5—16.1(-19.8) cm wide, palmately divided, 5-partite, pubescent on both surfaces or subglabrous on adaxial surface; petioles 2.7—5.5 cm long. Pedicels 4.5—6.8 cm long, densely velutinous. Stamens numerous; filaments winged at base, sparsely pubescent. Carpels 3—5, fusiform, sparsely pubescent or glabrous. Follicles 2—4, 1.7—2.3 cm long, sessile, glabrous or subglabrous; seeds many, with membranous wings on the surface.

Flowering June to July; fruiting July to August.

Endemic; in woods and on slopes between 1700 and 2400 m in the central mountains (Fig. 2).

**Ilan:** Nanau: Hsulawa (Kyanrawa), T. Suzuki 6998(TAI), Mt. Taipingshan, R. Kanehira s.n. Jul 1924(TAIF), S. Suzuki s.n. Jul 1929(TAI); **Taichung:** Mt. Nanhutashan, J. Ohwi 3921(KYO), G. Masamune, Hukuyama & Nagamura 2974(TAI), 1829 m, S. Sasaki s.n. Jul 1922(TAI), Ssuyuan-yako, C.S. Kuoh 1785(TAI), 1750 m, Y.C. Lu 117(HAST), 1900 m, K.C. Yang 2072(TAI), 1900-2790 m, J.C. Wang et al. 3855(TAI). **Nantou:** Jenai: Tienchih to Kuailin, 2160 m, H.L. Ho et al. 628(HAST). **Hualien:** Hoping logging tract, 41-46 Km, 1900-2000 m, J.C. Wang et al. 8536(TAIF), 60.5 Km, 2000 m, S.Y. Lu 12690(TAIF); Hsuilin: Tawusaishe (Tausai), 2120 m, T. Suzuki, Hukuyama & Simada 17702(TAI).

**Note:** The surface of the stamens and carpels ranges from pubescent to sparsely pubescent to subglabrous, and is even sometimes glabrous. The leaf shape and both surfaces of the leaf and leaf margin are also variable, making difficult to distinguish species based on such characters. The surface character of the leaves, stamens and carpels vary greatly in Taiwanese *Aconitum* group. According to the principle of priority (Article 11, ICBN) we treat Taiwanese group of *Aconitum* as *A. fukutomei*, with *A. bartlettii* (Liu and Hsieh, 1976) as a synonym. In addition, a small group of plants distributed at middle altitudes, and with a scandent habit but otherwise similar to the typical taxon, is treated as a variety, *A. fukutomei* var. *formosanum*.

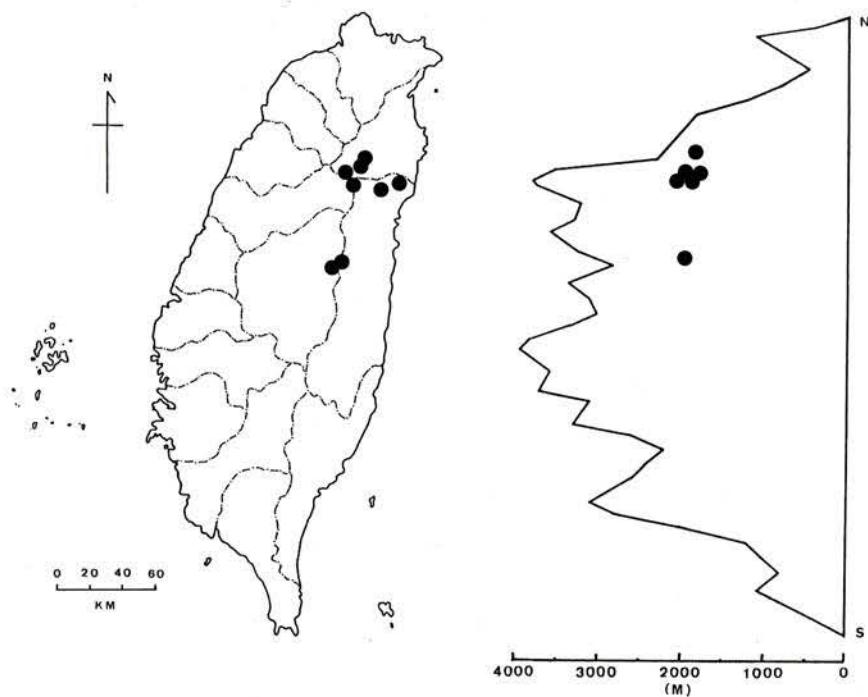

Fig. 2. Latitudinal and altitudinal distribution of *Aconitum fukutomei* var. *formosanum*.

## 2. ANEMONE L. 銀蓮花屬

Perennial erect herbs with underground tubers. Leaves simple or ternate, alternate, or/and radical, few to many, palmately divided; nerves palmate; petiolate. Scapes erect or upwardly ascending; inflorescence a cyme or umbel, or a single flower; bracts 2 to 3, or more, alternate or whorled and forming an involucre, palmately divided or unlobed, sessile or petiolate. Flowers bisexual, actinomorphic, white, purplish-blue or pale pink; sepals 5 or more, petaloid, imbricate, deciduous; petals absent; stamens numerous, anthers elliptic-globose or oblong-globose, filaments linear; carpels numerous or rather few, styles short or lacking, pilose or glabrous, ovaries pubescent or glabrous, each with 1 pendulous ovule. Achenes ovate-globose or nearly globose, rarely compressed, sessile, short or long stalked, pubescent.

About 120 species, almost cosmopolitan, mainly distributed in Asia and Europe; 60 species in mainland China and two species in Taiwan.

### Key to the species

1. Subshrubs; leaves ternate, terminal leaflets more than 5.0 cm long; flowers more than 2.0 cm in diam. .... 2.2. *A. vitifolia*
1. Herbs; leaves bipinnate; terminal leaflets less than 3.0 cm long; flowers less than 1.5 cm in diam. .... 2.1. *A. stolonifera*

**2.1. *Anemone stolonifera* Maxim.** in Bull. Acad. Imp. Sci. St.-Petersb. **22:** 225. 1877; Hayata, Icon. Pl. Form. **3:** 6. 1913; Sasaki, List Pl. Form. 182. 1928; Kudo & Masamune in Ann. Rep. Taihoku Bot. Gard. **2:** 76. 1932; Suzuki, Short Fl. Form. 64. 1936; Masamune, List Vasc. Pl. Taiwan 52. 1954; Huang in Bull. Taiwan Norm. Univ. **5:** 10. 1960; Liu and Hsieh, Fl. Taiwan **2:** 480. 1976; Wang, Fl. Reip. Pop. Sin. **28:** 10. 1980.

匍枝銀蓮花（三花銀蓮花）Fig. 3

*Anemone takasagomontana* Masamune in Not. Syst. **6:** 37. 1937.

Perennial erect herbs, 15—30(-45) cm tall, pubescent. Leaves simple, radical, 1.83—3.07 cm long, 3.15—4.55 cm wide, ternately divided, widely ovate; pubescent on both surfaces; petioles 7.6—15 cm long. Terminal segments (1.5-) 1.67—2.71(-32) cm long, (1-)1.21—1.83(-2.2) cm wide, ovate or widely elliptic; apex acute; base obtuse. Scapes 2, 13—29 cm long, upwardly ascending. Inflorescence an umbel or sometimes a single flower; pedicels pubescent, 2.8—11.5 cm long; bracts 2 or 3, ternately divided, petiolate. Flowers 6—16 mm in diam., white. Sepals 5, 7—10 mm long, 4—6 mm wide, obovate or widely elliptic; apex obtuse or rounded; glabrous on adaxial side, pubescent on abaxial side. Stamens numerous, 2—3.5 cm long, glabrous; anthers 0.6—1.2 mm long, ellipsoid-globose; filaments linear. Carpels 20 or more, pubescent; styles short; ovaries pubescent, each with 1 pendulous ovule. Achenes 10 or more, 2—3 mm long, narrowly ovate-globose, sessile, puberulous.

Flowering June to August; fruiting July to September.

Fig. 3. *Anemone stolonifera* Maxim. 1. Habit; 2. & 3. Sepals, 2, adaxial and 3, abaxial sides; 4. & 5. Stamens; 6. Carpels; 7. Achene.

Distributed in mainland China (Heilongjiang, Hubei and Sichuan) and Taiwan, Korea and Japan. Taiwan in shady places in forests at high altitudes in the northern part of the island (Fig. 4).

**Taichung:** Hoping, Mt. Hsueshan, 3600-3884 m, S.P. Li 173(KUN, TNM), from 369 Lodge to the cirque, in Abies forests, 3200-3350 m, C.I. Peng 9670(HAST), to Tsueichi, 3200-3884 m, J.C. Wang, Huang & Tang 4425(TAI, TNU). Rontabunsan, U. Mori s.n. Apr 1910(TAIF).

**2.2. *Anemone vitifolia* Buch.-Ham. ex DC., Syst. 1: 210. 1818; Wang, Fl. Reip. Pop. Sin. 28: 27. 1980. —*Ericapetilla vitifolia* (Buch.-Ham. ex DC.) Nakai in Journ. Jap. Bot. 17(1): 269. 1941.**

小白頭翁 (野棉花)

*Anemone vitifolia* var. *matsudai* Yamamoto in Suppl. Icon. Pl. Form. 3: 27. 1927. —*Ericapetilla vitifolia* var. *matsudai* (Yamamoto) Nakai in Journ. Jap. Bot. 17(1): 270. 1941. —*Anemone matsudai* (Yamamoto) Tamura ex Hsieh & Yang, Nom. Pl. Taiwan 440. 1969.  
*Anemone hupehensis* Lem. form. *alba* W.T. Wang in Act. Phytotax. Sin. 12(2): 180. 1974.

Perennial erect pubescent herbs, 30—120 cm tall. Leaves ternate, radical, (6.0-)6.3—11.6(-14.3) cm long, (4.6-)4.7—7.9(-8.6) cm wide, elliptic or ovate; apex acute; base obtuse, truncate or acute, lateral ones oblique; ternately divided or unlobed; puberulous on adaxial surface, tomentose on abaxial surface; petioles 5.5—36.0 cm long. Scapes usually 1, erect, pubescent. Inflorescence a compound dichasium; pedicels 6.5—17.8 cm long; bracts 2 or 3, opposite or whorl, ternately or sometimes palmately divided, pubescent on both sides; petiolate. Flowers 2.5—3.8 cm in diam., white, or pale pink on the mainland. Sepals 5 or more, unequal, 1—2 cm long, 1—1.8 cm wide, ovate, broadly elliptic or obovate; apex acute or retuse; imbricate; glabrous on adaxial side, pubescent on abaxial side. Stamens numerous, anthers 2—8 mm long, elliptic-globose; filaments linear. Carpels numerous; styles pilose. Achenes 2.5—3.5 mm long, ovate-globose, many, pilose; subsessile; aggregated in a globose head.

Flowering May to October (-November); fruiting June to December.

Distributed in northern Burma, Bhutan, Nepal, northern India, Sikkim, mainland China (Yunnan, southwestern Sichuan and southeastern and southern Xizang) and Taiwan. Taiwan, widely distributed in open places between 800 and 3200 m (Fig. 5).

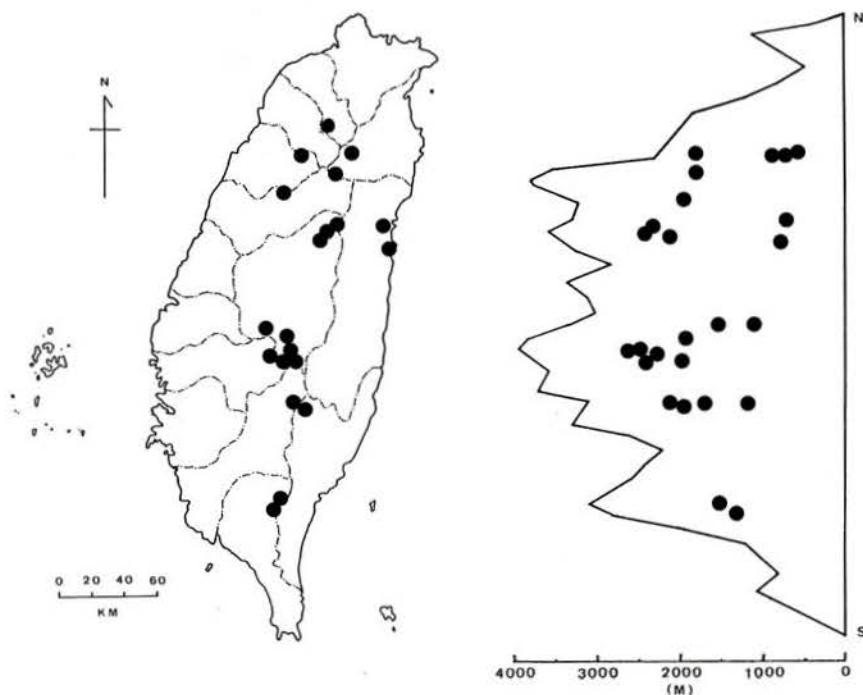

Fig. 5. Latitudinal and altitudinal distribution of *Anemone vitifolia* in Taiwan.

May 1919(TAIF); Hsiulin: Taroko National Park, Tali to Tatung, 880-1080 m, C.H. Chen & Hung 1116(HAST). **Taitung:** S. Sasaki s.n. May 1916(TAIF); Haituan, Hsiangyang to Hsiangyang Lodge, 2200 m, C.H. Chen 631(HAST), S. Cross-Island Highway, C.H. Ou 1358(TCF), Mt. Kuanshanlinshan, S.T. Chiu 1419(TNM), C.S. Kuoh 11999(NCKU), 12959 (coll. by J.P. Wang, NCKU).

**Note:** This taxon is very similar to *A. hupehensis* Lem. and *A. tomentosa* (Maxim.) Pei, differing only in hair pattern on the abaxial leaf surface (densely velutinous and tomentose) and flower color (white, pale pink and pink). However, such characters are variable and overlap on the same individual. We have not seen enough specimens from the mainland so we will continue to recognize *A. vitifolia* even though the Taiwanese plants have been treated as *A. hupehensis* form. *alba* (Wang, 1974, 1980). More investigations are needed for this complex group in the future.

### 3. CALATHODES Hook. f. & Thomson 雞爪草屬

Perennial erect herbs with fibrous roots. Leaves simple, radical and caudate, ternately or palmately divided, usually 5-partite; petiolate. Flowers solitary, terminal, bisexual, actinomorphic, colored; sepals 5, petaloid, yellow or white, imbricate, deciduous; petals absent; stamens numerous, anthers elliptic-globose, filaments narrowly linear; carpels 5—70, sessile or short-stipitate, ovules 8—10, 2-seriate at the base of the carpel. Follicles subcoriaceous, styles persistent after anthesis. Seeds many, obovoid-globose, smooth. Distributed in the Himalaya, mainland China and Taiwan; one species in Taiwan.

**Calathodes polycarpa** Ohwi in Acta Phytotax. Geobot. 2(3): 153. 1933; Wang in Acta Phytotax. Sin. 12(2): 156. 1974, Fl. Reip. Pop. Sin. 27: 67. 1979.

Type: Taiwan: Ilan: Mt. Nanhutashan, J. Ohwi 4211 (holotype: KYO!; isotype: TAI!, TI!).  
多果雞爪草

*Calathodes palmata* auct. non Hook.f. & Thoms.: Liu & Hsieh in Fl. Taiwan 2: 480. 1976.

Perennial erect herbs with fibrous roots; stem glabrous, 30—40 cm tall. Leaves radical and caudate, ternately or palmately divided, 5-partite, 4.2—5.5 cm long, 6.5—9 cm wide; apex acute; base cordate; margin serrate; glabrous on both sides; terminal segment (4.2-)4.5—5.5(-5.6) cm long, (2.4-)2.5—2.9(-3.1) cm wide, apex acute, base acute; petioles 7—13.5 cm long. Flowers solitary, terminal, 1.8—3 cm diam., white or greenish-white; pedicels 6.5—16.3 cm long. Sepals 5, 1.2—1.6 cm long, 6—9 mm wide, elliptic or obovate. Petals absent. Stamens numerous; anthers elliptic-globose, 2 mm long; connective shortly excurrent beyond the pollen sacs; filaments narrowly linear, 4—6.5 mm long. Carpels 30—60, sessile, 4.5 mm long; styles recurved. Follicles 7—10 mm long, triangular-gibbous, keeled on ventral surface; styles 1.5—2 mm long. Seeds 1.5—2 mm long.

Flowering June to July; fruiting July to August.

Distributed in northeastern Yunnan, western Guizhou, southwestern Hubei and Taiwan. Taiwan, open slopes at high altitudes in the northern part of the island (Fig. 6).

**Nantou:** Mt. Nengkaoshan, Tienchi to Nengkao Pass, T.C. Huang et al. 5814 (TAI), M. Tamura & Koyama 23333 (TI). **Hualien:** Mt. Chungyangchienshan (Tyuo-senzan), N. Fukuyama & Suzuki 15224 (TAI).

### 4. COPTIS Salisb. 黃連屬

Perennial erect herbs with creeping yellowish rhizomes. Leaves radical, ternately to palmately divided, 3 to 5-partite, sometimes ternate to triternate; petiolate. Scapes 1 or 2,

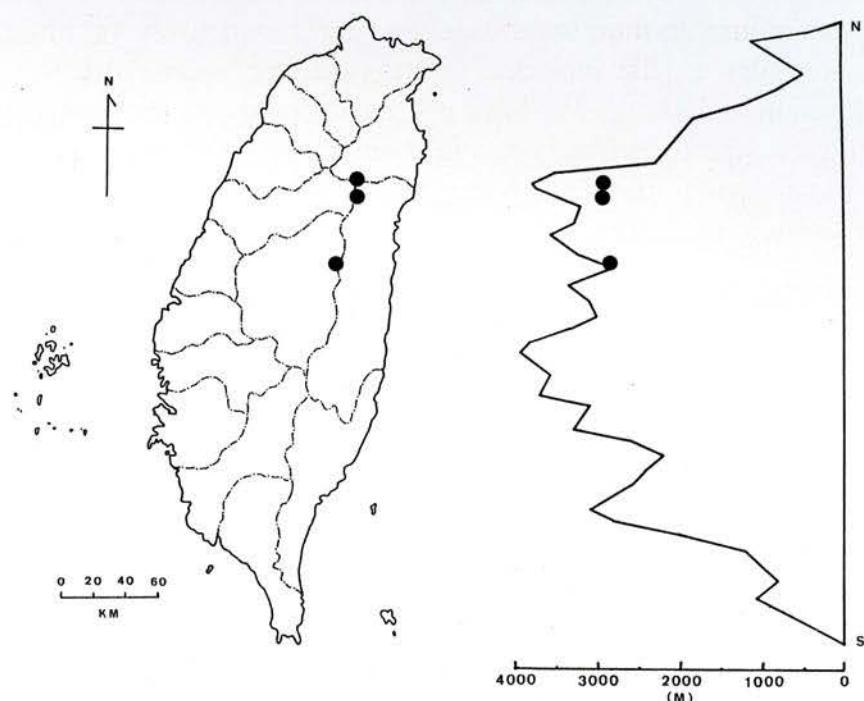

Fig. 6. Latitudinal and altitudinal distribution of *Calathodes polycarpa* in Taiwan.

erect; inflorescence a monochasium, dichasium to pleiochasium, or sometimes a single flower; bracts lanceolate, usually pinnately divided. Flowers small, bisexual, sometimes unisexual, actinomorphic, white or yellowish-green; sepals 5 or 6, petaloid, elliptic, deciduous; petals 5 or 6, shorter than sepals, oblanceolate or spatulate, clawed, nectariferous or not; stamens numerous, anthers widely elliptic, filaments linear; carpels 5—14, stipitate. Follicles several, umbellately arrangement on receptacle, chartaceous, stipitate, stalks pubescent. Seeds few, oblong-glabose, brown, nitid, with a crustaceous testa.

About 16 species in temperate regions of the northern hemisphere, 6 species in mainland China and only one species in Taiwan.

*Coptis quinquefolia* var. *ramosa* (Makino) Ohwi, Fl. Japan 457. 1956.

Perennial erect herbs with short rhizomes. Leaves radical, 1.5—4.5 cm long, 2—6 cm wide, palmately divided, 5-partite; petioles 3—12 cm long. Terminal segment (1.3-)1.8—3(-

4) cm long, (0.6-)0.9—1.5(-1.9) cm wide, rhombate or narrowly rhombate; apex acute; base acute; 3-lobed or more; margin mucronate-serrate; glabrous on both surfaces; nerves elevated on adaxial side, flat on abaxial side. Scapes 1, 4.5—20 cm long, erect; flowers solitary or sometimes in a dichasium; bracts lanceolate; pedicels 1—7.5 cm long. Flowers 9—12 mm in diam., bisexual, white. Sepals 5—6, 4.5—8 cm long, 2.8—5 cm wide, petaloid, elliptic or obovate-elliptic; apex round or obtuse. Petals 5, 1.6—3 mm long, spatulate, base clawed, nectariferous with Stamens 20. Carpels 10—12, stipitate; styles curved. Follicles 3—10 mm long; stipitate 3—5 mm long. seeds 5—10.

Flowering January to May (-June); fruiting (March-) April to August.

Distributed in Japan and Taiwan; Taiwan, wet places in forests between 900 and 1500 m (Fig. 7).

### 5. DICHOCARPUM W. T. Wang & Hsiao 人字果屬

Perennial erect herbs with rhizomes. Leaves radical and caudate or radical only, alternate, ternately or pedately compound, terminal segments simple, unlobed or slightly lobed; petiolate. Inflorescence a monochasium or cyme; bracts 3-lobed or ternately divided. Flowers bisexual, actinomorphic, white, rarely pale yellow or pale pink; sepals 5, petaloid, elliptic or obovate, white or pale yellow, deciduous; petals 5, much smaller than sepals, round or obovate with a slender claw, tip entire or retuse, sometimes slightly 3 or 4-lobed; stamens 5—25, anthers obovate-globose or widely ellipsoid-globose, yellow, filaments linear; carpels 2, erect, oblong, connate at base, sessile; ovules numerous. Follicles 2, obovate-linear or narrowly oblong with small beak at apex, divaricate or patent. Seeds many, round-global, rarely elliptic-global, brown, nitid, usually smooth, sometimes verruculose or scaberulous.

About 16 species distributed in the Himalaya and eastern Asia; 9 species in mainland China and only one species in Taiwan.

**Dichocarpum adiantifolium** (Hook. f. & Thoms.) W.T. Wang & Hsiao in Acta Phytotax. Sin. **9(4)**: 329. 1964; Fu in Acta Phytotax. Sin. **26(4)**: 256. 1988. — *Isopyrum adiantifolium* Hook.f. & Thoms., Fl. Ind. I: 42. 1855.

Kawakami & Mori s.n. Mar. 1908 (TI!).

Perennial erect glabrous herbs, 7—20 cm tall, with creeping rhizomes. Leaves radical and caudate, biternately or pedately compound; petioles 5.5—8.5 cm long. Terminal segments (0.7-)0.8—1.4(-1.8) cm long, (0.8-)1—1.5(-2) cm wide, broadly rhombate; apex retuse; base rounded or truncate; slightly lobed; glabrous on both surfaces. Scapes 1 or 2, 3.5—15.5 cm long, erect. Inflorescence a cyme; bracts ternately divided; pedicels 8—25 mm long. Flowers 6—10 mm in diam., white. Sepals 5, ca. 3.5—4.5 mm long, 1.5—2.5 mm wide, elliptic, oblong or obovate. Petals 5, round, ovate, obovate or elliptic with a slender claw, apex entire, emarginate or 2-lobed. Stamens 5—10, anthers obovoid-glabrose; filaments linear, 2—4 mm long. Carpels 2, erect, 2—3 mm long, connated at base. Follicles 2, 7—10 mm long, narrowly oblong with small beak at apex, patent. Seeds many, globose, brown, nitid, smooth.

Flowering (January-) February to May (-September); fruiting March to July (-October).

Distributed in mainland China (Hunan, Sichuan, Guizhou, Yunnan and Xizang), India and Taiwan; Taiwan, on mountainous areas of Central to northern parts (Fig. 9).

## 6. RANUNCULUS L. 毛茛屬

Annual or perennial terrestrial herbs, or sometimes aquatic or semi-aquatic; upright, spreading or sometimes creeping. Roots fibrous and/or stoloniferous rhizomes. Leaves

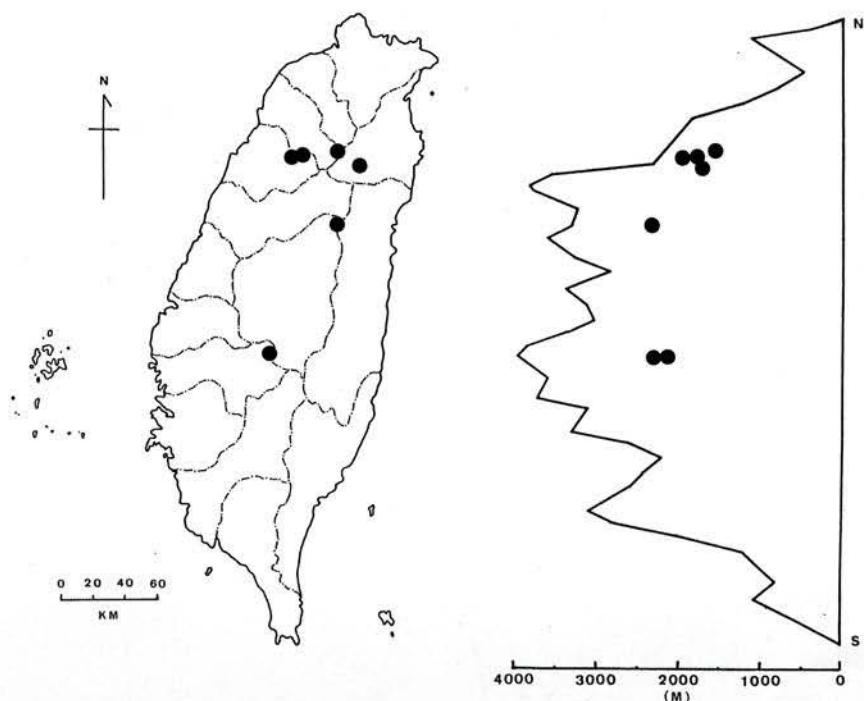

Fig. 9. Latitudinal and altitudinal distribution of *Dichocarpum adiantifolium* in Taiwan.

dimorphoic or monomorphic, simple, ternate, bi ternate, pinnate or bipinnate; unlobed, 3-or more lobed to 3-partited; chartaceous or subcoriaceous; margin entire, or serrate; alternate or radical leaves a basal rosette, with long sheathing petioles; caudine leaves short-petiolate, subsessile to sessile; stipules absent. Inflorescence a cyme or flowers solitary, terminal or axillary. Flowers bisexual, actinomorphic, yellow, white, or red; sepals 5, green, deciduous; petals larger than sepals, usually 5, sometimes 6 or up to 10, with a nectariferous spot, cup-shaped or covered by a scale, claw at base; stamens numerous, glabrous, anthers oblong or narrowly ovate, filaments linear; carpels many, with an ascending ovule, spiral arranged on glabrous or pubescent receptacle. Fruits aggregated forming a globose or ellipsoidal head; achenes ovate, orbicular, obovate or elliptic, compressed or convex in lateral view; glabrous or hairy, scabrous or papillate; style persistent or not, or lengthening to become beaklike after anthesis.

About 250 species in the temperate and frigid regions in worldwide, mainly in Asia and Europe; about 80 species in Mainland China and 11 species in Taiwan.

#### Key to the species

1. Leaves dimorphic
2. Carpels and achenes pubescent ..... 6.7. *R. nankotaizanus*
2. Carpels and achenes glabrous
  3. Plants glabrous or nearly so; fruits compressed in laterally ..... 6.8. *R. sceleratus*
  3. Plants pubescent or sparsely pubescent; fruits convex in lateral view
    4. Leaves glabrous or nearly so; margin entire ..... 6.5. *R. junipericolus*
    4. Leaves pubescent; margin coarsely serrate or serrate
      5. Radical leaves 2.7—5.9 cm wide; achenes 1.5—4 mm long ..... 6.4. *R. japonicus*
      5. Radical leaves 1.2—2.2 cm wide; achenes ca. 1—1.5 mm long .....

- ..... 6.11. *R. ternatus*
1. Leaves monomorphic
    6. Leaves glabrous or nearly so
      7. Leaves entire; flowers 8—10 mm in diam. .... 6.2. *R. cheiophyllus*
      7. Leaves biternate or bipinnate; flowers 20—25 mm in diam. .... 6.6. *R. morii*
    6. Leaves pubescent or sparsely pubescent
      8. Fruits convex in lateral view; achenes less than 3 mm long; plants usually under 10 cm tall
        9. Flowers more than 12 mm in diam. .... 6.3. *R. formosa-montanus*
        9. Flowers less than 12 mm in diam. .... 6.10. *R. taisanensis*
      8. Fruits compressed in lateral view; achenes > 3.0 mm long; plants usually over 15 cm tall
        10. Plants spreading and/or upright; roots fibrous and stoloniferous rhizomes .... 6.9. *R. sieboldii*
        10. Plants upright not spreading; roots fibrous .... 6.1. *R. cantoniensis*

**6.1. *Ranunculus cantoniensis* DC.**, Prod. Syst. Nat. 1: 43. 1824; Ohwi, Fl. Jap. 526. 1953; Masamune, List Vasc. Pl. Taiwan 53. 1954; Liou, Fl. Reip. Pop. Sin. 28: 321. 1980.

禹毛茛 (水辣菜)

*Ranunculus sieboldii* auct. non. Miq.: Liu & Hsieh, Fl. Taiwan 2: 506. 1976.

Perennial pubescent herbs, upright, 12—70 cm tall. Roots fibrous. Leaves monomorphic, ternate or simple, terminal ones 3-partited, (19-) 29.1—50.9(-67) mm long, (15-) 22.2—44.2 (-65) mm wide; ovate or widely elliptic; 3-or more lobed; apex acute; base obtuse, acute or truncate; margin serrate; sparsely pubescent on adaxial surface, pubescent on abaxial surface; petioles 3.7—18 cm long. Inflorescence a scorpioid cyme or cyme; pedicels 1.2—8 cm long, pubescent. Flowers 9—18 mm long in diam., yellow. Sepals 5, 4.5—6 mm long, 2—4 mm wide; spreading, broadly elliptic or elliptic, pubescent outside, glabrous inside. Petals 5, 6—7 mm long, 3—4 mm wide; obovate or elliptic, glabrous on both sides. Stamens numerous, ca. 2.5—4.5 mm long, anthers oblong, 1—1.5 mm long, filaments linear. Carpels many, glabrous; receptacles glabrous. Fruiting head globose; achenes 3—5 mm long, obovate-orbicular, glabrous, compressed laterally; styles persistent, short, recurved.

Flowering (March-)April to August (-September); fruiting May to October (-February).

Widely distributed around India, southwestern, southern and southeastern mainland China (Yunnan, Sichuan, Guezhou, Hubei, Hunan, Guangxi, Guangdong, Fujian, Jiangxi, Zhejiang and Jiangsu), Vietnam, Hongkong, Taiwan, Japan and Korea. Taiwan, semi-wet places, stream sides, and forest margins, below 2500 m, but sometimes to 3000 m (Fig. 10).

掌葉毛茛 Fig. 11

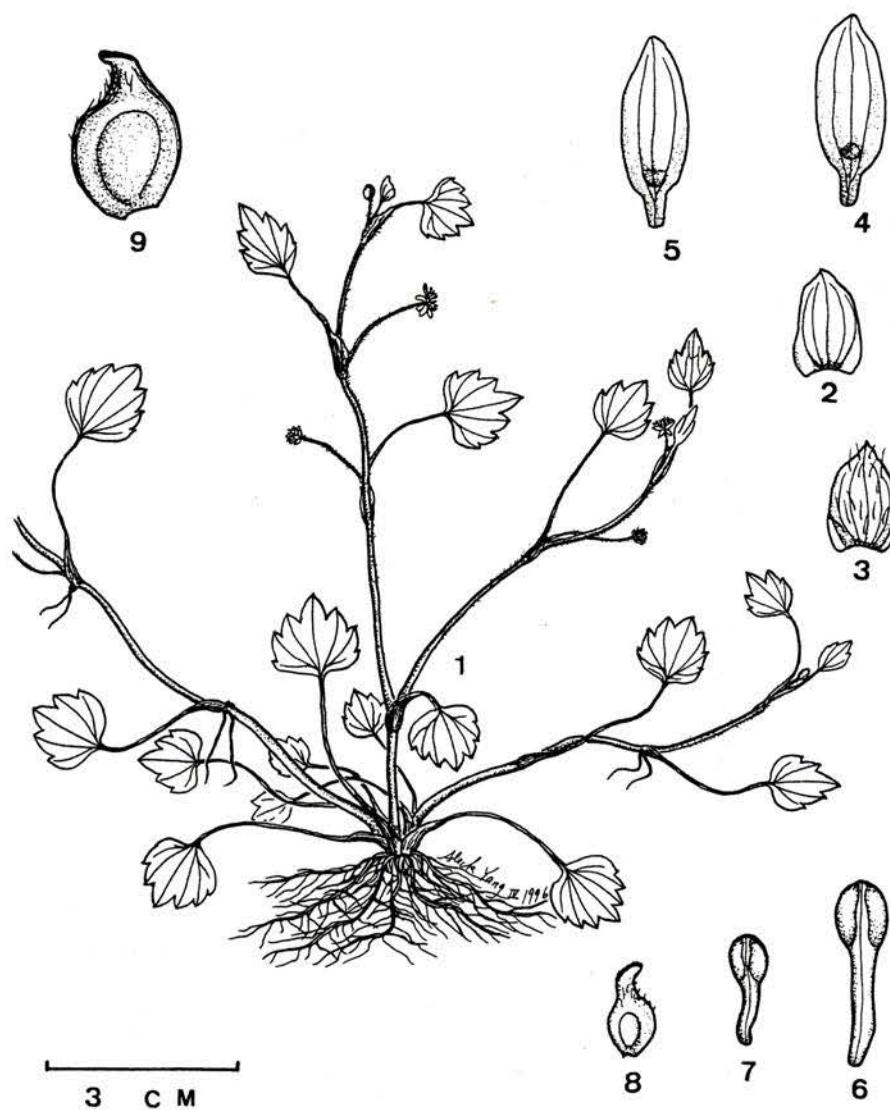

Fig. 11. *Ranunculus cheiophyllum* Hayata. 1. Habit; 2. & 3. Sepals, 2, adaxial and 3, abaxial sides; 4. & 5. Petals, 4. adaxial and 5, abaxial sides; 6. & 7. Stamens; 8. Carpel; 9. achene.

Perennial rhizomatous glabrous or sparsely pubescent creeping herbs, 21—65 mm tall. Roots fibrous. Leaves monomorphic, simple, (9-)9.6—14.4(-18) mm long, (10-)10.4—13.8(-15) mm wide; orbicular, broadly ovate or elliptic, 5- or more lobed; apex acute; base rounded, obtuse, truncate or cordate; margin entire or sometimes coarsely serrate; glabrous or nearly so on adaxial surface, sparsely pubescent or subglabrous on abaxial surface; petioles 14—65 mm long, pubescent. Flowers solitary, axillary, 8—10 mm in diam., yellow; pedicels 12—66 mm long, pubescent. Sepals 5, 2—3 mm long; spreading, broadly elliptic or elliptic, sparsely pubescent outside, glabrous inside. Petals 3—5, 4 mm long, 2

mm wide; narrowly obovate or narrowly elliptic, glabrous on both sides. Stamens numerous, 2 mm long, anthers oblong, 1 mm long, filaments linear. Carpels many, sparsely pubescent or subglabrous; receptacles hairy. Fruiting head globose; achenes 1—1.5 mm long, elliptic-orbicular to obovate-orbicular, subglabrous, convex in lateral view; styles persistent, short, recurved.

Flowering (November-) January to May; fruiting April to June (-July).

Endemic; wet places between 1000 and 2600 m in the central mountain (Fig. 12).

蓬萊毛茛 (疏花毛茛, 南湖毛茛)

Perennial rhizomatous pubescent herbs, spreading or upright, 5—25(-30) cm tall. Roots fibrous. Leaves monomorphic, simple, (8-)9.9—22.7(-28) mm long, (9.0-)16.4—33.6(-46.0) mm wide; ovate, orbicular-cordate or deltoid, 3-partited, each segment 3-5-lobed; apex acute; base turncate or cordate; margin coarsely serrate; pubescent on both surfaces or sparsely pubescent on adaxial surface; petioles 1.5—12 cm long. Inflorescence a terminal cyme; pedicels 2.8—10.8 cm long, pubescent. Flowers (10-)15—24 mm in diam., yellow. Sepals 5, 4—5 mm long, 2 mm wide, spreading, broadly elliptic or elliptic, pubescent outside, glabrous inside. Petals 5, 7—12 mm long, 6—10 mm wide; obovate, glabrous on both sides. Stamens numerous, 2.5—4 mm long, anthers oblong, 1—1.5 mm long, filaments linear. Carpels many, glabrous; receptacles glabrous. Fruiting head ellipsoid; achenes 1.8—3 mm long, elliptic-orbicular to obovate-orbicular, glabrous, convex in lateral view; styles persistent, becoming a beaklike after anthesis, recurved.

Flowering May to July (-August); fruiting June to September (-October).

Endemic; open places and sunny slopes above 2600 m in the central mountains (Fig. 13).

毛茛 Fig. 14

Perennial rhizomatous pubescent herbs, upright or spreading, 15—45 cm tall. Roots fibrous. Leaves dimorphic, sparsely pubescent on adaxial surface, pubescent or sparsely pubescent on abaxial surface. Radical leaves simple, 3-lobed to 3-partited, (17-)19.2—39.8(-53) mm long, (18-)26.9—59.3(-70) mm wide; orbicular or ovate; apex acute; base rounded, truncate or cordate; margin coarsely serrate; petioles 4.4—33.5 cm long. Cauline leaves 3-partite, segments narrowly oblong or narrowly elliptic; apex acute; base rounded or obtuse; margin entire or sometimes coarsely serrate; sessile or subsessile. Inflorescence in a terminal cyme; pedicels 2—8 cm long, pubescent. Flowers 8—20 mm long in diam., yellow. Sepals 5, 3.8—5 mm long, 1.5—2.5 mm wide, spreading, ovate or elliptic, pubescent outside, glabrous inside. Petals 5 or sometimes more, 8—13 mm long, 5—9 mm wide, obovate or narrowly obovate, glabrous on both sides. Stamens numerous, 2.5—4.5 mm long, anthers oblong, 1.0—1.5 mm long, filaments linear. Carpels many, glabrous; receptacles glabrous. Fruiting head ellipsoid to globose; achenes 1.5—4 mm long, ellipsoid-orbicular to ovoid-orbicular, glabrous, convex in lateral view; styles persistent, indistinct.

Flowering March to May; fruiting April to June.

Mainland China (except Xizang), Japan, Korea and Russia. Taiwan, limited distribution in open places and forest margins below 800 m of northern part (Fig. 15).

**Taipei:** Shimen: *Yang, Chang & Sung* 6250(HAST, TAI, TAIF, TNM, TNU), Fukueichiao, *T. Kawakami s.n.* May 1915(TAIF), *S. Sasaki s.n.* May 1915(TAIF). **Keelung:** Hsientung, *S. 高山毛茛 (檜林毛茛) Fig. 16

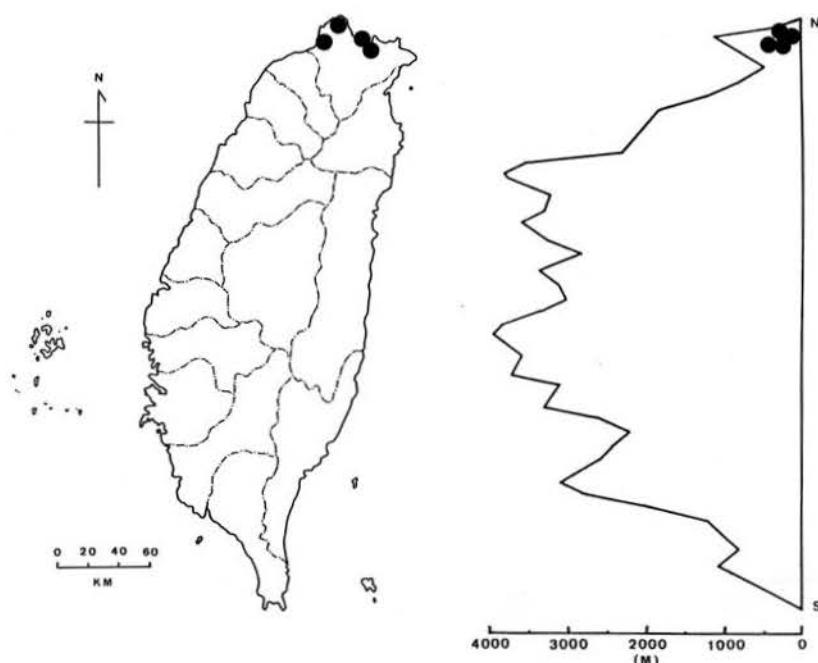

Fig. 15. Latitudinal and altitudinal distribution of *Ranunculus japonica*.

Perennial rhizomatous pubescent herbs, upright, 8—30 cm tall. Roots fibrous. Leaves dimorphic, glabrous or nearly so on both surfaces except margin slightly pubescent. Radical leaves simple, 3-lobed or 3-partite, (12-)14.7—21.3(-24) mm long, (12-)14.6—23.2(-30) mm wide; ovate or deltoid; apex acute; base rounded, obtuse or cordate; margin entire or coarsely serrate; petioles 2—5 cm long. Cauline leaves 3-parted, segments narrowly oblong or lanceolate; apex acute; base obtuse; margin entire; petioles short tonearly absent, sparsely pubescent. Inflorescence a terminal cyme or flowers solitary axillary; pedicels 2—5.4 cm long, pubescent. Flowers 8—12 mm long in diam., yellow. Sepals 5, 4—5 mm long, 2—3.5 mm wide, spreading, elliptic, pubescent outside, glabrous inside. Petals 5, 4.5—7 mm long, 2—3 mm wide; oblong or elliptic, glabrous on both sides. Stamens numerous, 3 mm long, anthers oblong, 1 mm long, filaments linear. Carpels many, glabrous; receptacles glabrous. Fruiting head ellipsoid; achenes 1.5—2.5 mm long, ellipsoid-orbicular to ovoid-orbicular, glabrous, laterally convex; styles persistent, becoming a beaklike after anthesis, recurved.

Flowering May to July; fruiting June to September.

Endemic; wet places and coniferous woods above 2700 m in the central mountains (Fig. 17).

**Hsinchu:** Chienshih: Mt. Tapachienshan, *S. Sasaki s.n.* Jul 1932(TAI), Shancha Shelter to Mt. Tapachienshan, 3000-3500 m, J.C. Wang, Huang & Yang 4569(TAI). **Taichung:** Hoping: Mt. 石龍芮

Annual glabrous herbs, aquatic or semi-aquatic, upright, 10—50 cm tall. Roots fibrous. Leaves dimorphic, glabrous on both surfaces. Radical leaves simple, 3-parted or more irregular lobed, (1.3)-2.01—3.69(-5.1) cm long, (2)-3.05—5.81(-8.2) cm wide; orbicular, ovate or deltoid, 3 or more lobed; apex acute; base rounded, truncate or cordate; margin coarsely serrate; petioles 3—9.5 cm long. Cauline leaves 3-lobed to 3-parted, 2.25—4.25 cm long, 3.35—5.95 cm wide; segments narrowly elliptic or narrowly oblong; apex acute; base rounded or truncate; margin coarsely and irregularly serrate or entire; short petiolate or subsessile. Inflorescence terminal cyme; pedicels 5—27 mm long, sparsely pubescent. Flowers 5—8 mm long in diam., yellow. Sepals 5, 2.5—3.5 mm long, spreading, broadly elliptic or elliptic, pubescent outside, glabrous inside. Petals 5, 3—4 mm long, obovate, glabrous on both sides. Stamens more than 10, 1.5—2 mm long, anthers ovate or oblong, 0.5 mm long, filaments linear. Carpels many, glabrous; receptacle glabrous. Fruiting head ellipsoid; achenes 1 mm long, obovoid-orbicular, glabrous, laterally compressed; styles persistent, short.

Flowering (January-) February to May; fruiting (February-) March to June or into summer.

Widely distributed in temperate and subtropical areas worldwide; Taiwan growing open places, stream sides and forest margins throughout (Fig. 22).

**Taipei City:** Hsinyi District: Yungchi Road, C.C. Hsu 4345(TAI), Sect. 3, Keelung Road, C.C. Hsu 4455(TAI), 6659(TAI); Shihlin: Yuanshan, Chou et al. 7575(TAI). **Keelung:** Keelung, T. 揚子毛茛 (辣子草)

Annual rhizomatous pubescent herbs, spreading or upright, sometimes creeping, 15—40 cm tall. Roots fibrous. Leaves monomorphic, ternate or simple, terminal ones 3-parted, (1.5-)2.14—4.4(-5.5) cm long, (2.3-)2.33—3.65(-5.1) cm wide; ovate or widely elliptic, unlobed or 3-lobed; apex acute; base obtuse; margin coarsely serrate; sparsely pubescent on adaxial surface, pubescent on abaxial surface; petioles 6.4—12.5 cm long. Inflorescence a cyme; pedicels 1.1—9.4 cm long, pubescent. Flowers 8—12(-15) mm in diam., yellow. Sepals 5, spreading, broadly elliptic or elliptic, pubescent outside, glabrous inside. Petals 5, 4—5 mm long, obovate or elliptic, glabrous on both sides. Stamens numerous, 2.5—3.5 mm long, anthers oblong, 1—1.5 mm long, filaments linear. Carpels many, glabrous; receptacle

glabrous. Fruiting head globose; achenes 3 — 5 mm long, obovoid-orbicular, glabrous, laterally compressed ; styles persistent, short, recurved.

Flowering September to April in next year; fruiting late September to June(-August).

Distributed in southern mainland China (Yunnan, Sichuan, Guizhou, Hubei, Hunan, Guangxi, Jiangxi, Jiangxu, Zhejiang, Fujian, Shaanxi, Gansu), Taiwan and Japan. Taiwan, narrowly distributed in semi-wet places and forest margins between 1000 and 3000 m in the central and northern parts of the island (Fig. 23).

*Ranunculus taisanensis* var. *tripartitus* Ohwi in Acta Phyto. Geobot. **2(3)**: 156. 1933; *syn. nov.* Type: Formosa: Takaoshu (Kaohsiung): m. Daibu (Mt. Tawushan), *J. Ohwi* 1807 (holotype: KYO!)

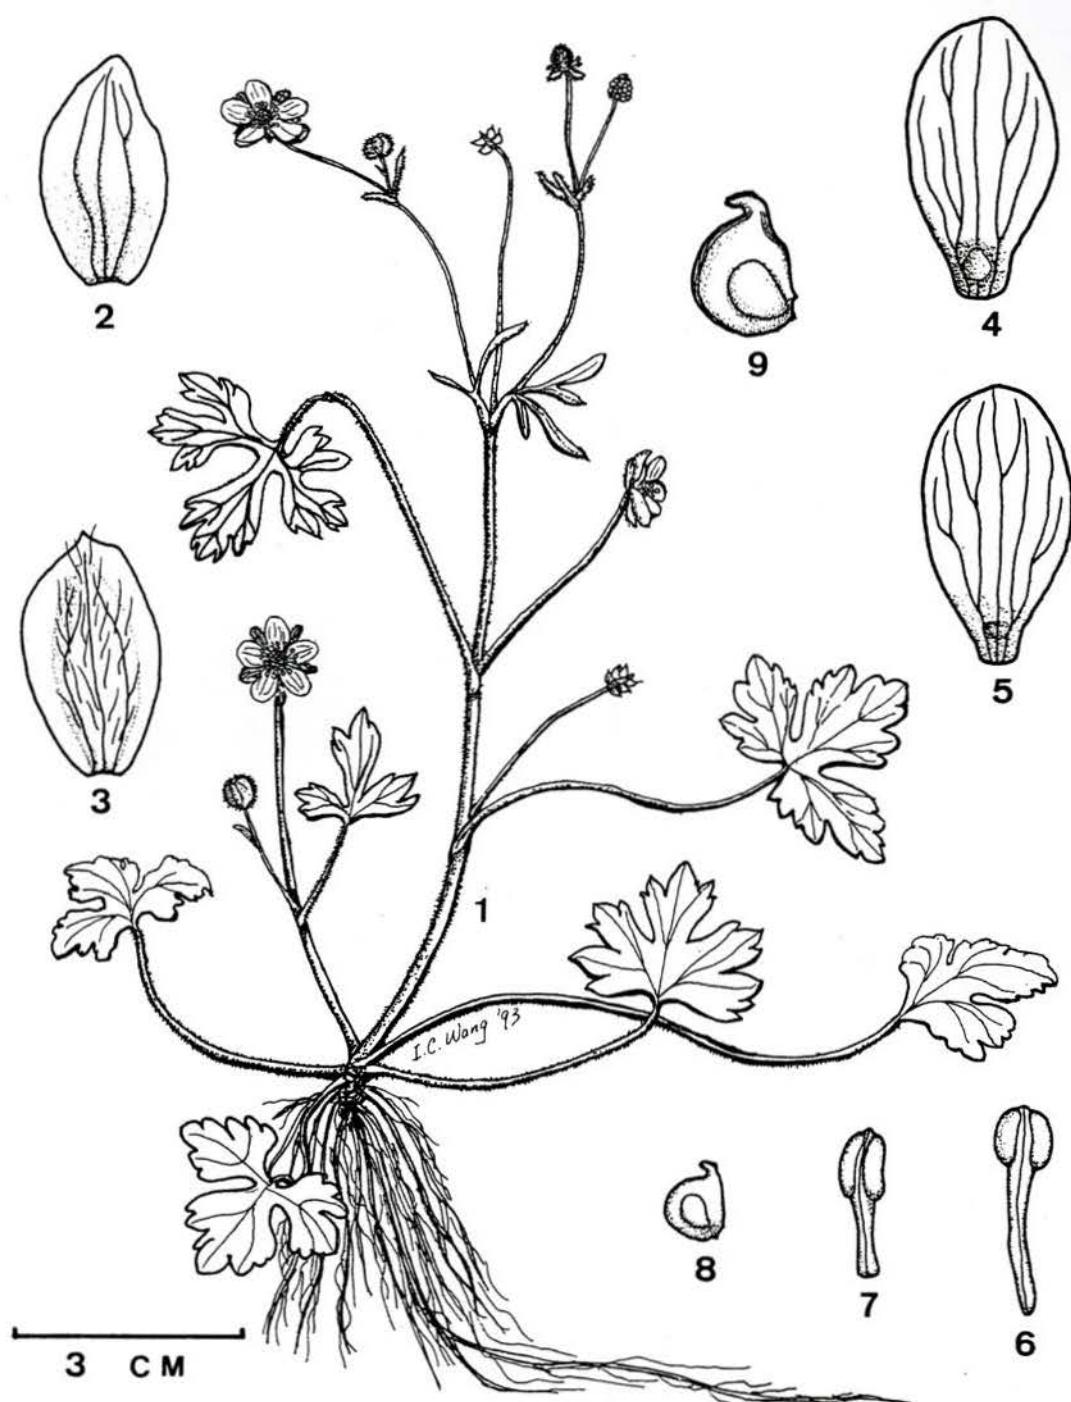

Fig. 24. *Ranunculus taisanensis* Hayata. 1. Habit; 2. & 3. Sepals, 2, adaxial and 3, abaxial sides; 4. & 5. Petals, 4. adaxial and 5, abaxial sides; 6. & 7. Stamens; 8. Carpel; 9. Achene.

Perennial rhizomatous pubescent herbs, upright, 5—20(-25) cm tall. Roots fibrous. Leaves monomorphic, simple, (0.6)-1.1—1.94(-3.9) cm long, (1.3)-1.71—2.95(-5) cm wide; ovate or deltoid, 3-lobed to 3-parted; apex acute; base obtuse, truncate or cordate; margin coarsely serrate; pubescent on both surfaces or sparsely pubescent on adaxial surface; petioles 2—12 cm long. Inflorescence a terminal cyme; pedicels 1.2—4.6 cm long, pubescent. Flowers ca. 5.0—10.0(-15.0) mm long in diam., yellow. Sepals 5, 4—4.5 mm long, 2—2.5 mm wide, spreading, broadly elliptic or elliptic, pubescent outside, glabrous

inside. Petals 5 to 10, 3.5—5 mm long, 2—3 mm wide; narrowly obovate or elliptic, glabrous on both sides. Stamens numerous, 2—2.5 mm long, anthers oblong, 1 mm long, filaments linear. Carpels many, glabrous; receptacles glabrous. Fruiting head ellipsoid to globose; achenes 1—3 mm long, ellipsoid-orbicular to ovoid-orbicular, glabrous, laterally convex; styles persistent, short, recurved.

Flowering April to September (-October); fruiting May to October (-December).

Endemic; widely distributed throughout between 1500 and 3500 m (Fig. 25).

小毛茛（貓爪草）

Perennial rhizomatous sparsely pubescent or subglabrous herbs, upright or spreading, 10—25(-30) cm tall. Roots fibrous. Leaves dimorphic, sparsely pubescent or nearly absent on adaxial surface, pubescent or sparsely pubescent on abaxial surface. Radical leaves simple, 3-parted or ternate, (0.7-)1.18—2.14(-2.4) cm long, (1)1.21—2.21(-3.1) cm wide; orbicular, ovate or broadly elliptic, unlobed, 3-lobed to 3-parted; apex acute; base rounded, obtuse, truncate or cordate; margin serrate or coarsely serrate; petioles 5—8.5 cm long. Cauline leaves 3-parted, segments narrowly oblong or lanceolate; apex acute; base rounded or truncate; margin coarsely serrate or entire; sessile or subsessile. Inflorescence a terminal cyme; pedicels 2.1—3.5 cm long, pubescent. Flowers 5—14 mm in diam., yellow. Sepals 5, spreading, broadly elliptic or elliptic, pubescent outside, glabrous inside, concave. Petals 5

or more, 5—7 mm long, obovate, narrowly obovate or elliptic, glabrous on both sides, claw 0.8 mm long. Stamens numerous, 2.5 mm long, anthers oblong, 1 mm long, filaments linear. Carpels many, glabrous; receptacles glabrous. Fruiting head ellipsoid to globose; achenes 1—1.5 mm long, ellipsoid-orbicular to ovoid-orbicular, glabrous, laterally convex; styles persistent, slender, hardly recurved.

Flowering (January-) February to April (-May); fruiting March to May (-June).

Distributed in mainland China (Guangxi, Jiangxi, Zhejiang, Jiangxi, Hunan, Anhwei, Hubei and Henan), Taiwan and Japan. Taiwan, semi-wet places and open places below 500 m in the northern part (Fig. 26).

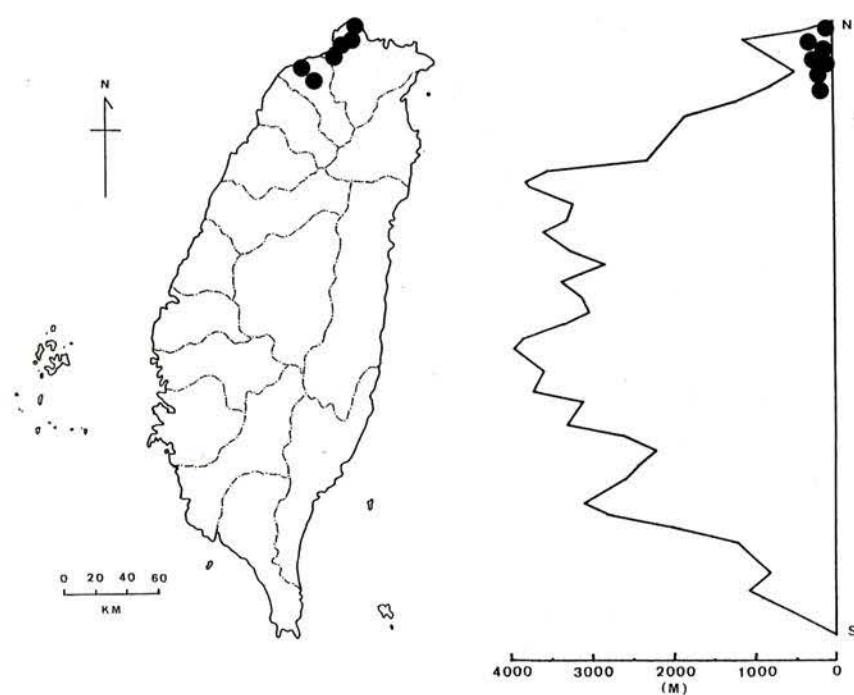

Fig. 26. Latitudinal and altitudinal distribution of *Ranunculus ternatus*.

## 7. TROLLIUS L. 金蓮花屬 (金梅草屬)

Perennial erect herbs with thick short rhizomes. Leaves simple, radical and/or cauline, alternate, ternately or palmately divided, usually 5-partite, sharply serrate; petiolate. Flowers solitary or rarely in cyme, terminal, bisexual, actinomorphic, colored; sepals 5, petaloid, yellow, rarely pale purple, imbricate, usually deciduous; petals 5 or more, linear, short-clawed, nectariferous at the base; stamens numerous, anthers ellipsoid or long-globose, filaments narrowly linear; carpels 5 to many, sessile, ovules many, 2-seriate at base of the

carpel. Follicles subcoriaceous, nerves elevated, reticulate, styles persistent after anthesis. Seeds many, globose or nearly so, smooth.

About 31 species in temperate regions of the northern hemisphere; 16 species in mainland China and one species in Taiwan.

**Trollius taihasenzanensis** Masamune in Journ. Soc. Trop. Agr. **6**: 570. 1934; Wang, Fl. Reip. Pop. Sin. **27**: 70. 1979.

*Trollius asiaticus* auct. non L.: Masamune in Bot. Mag. Tokyo **51**: 234. 1937; Liu & Hsieh in Fl. Taiwan **2**: 513. 1976.

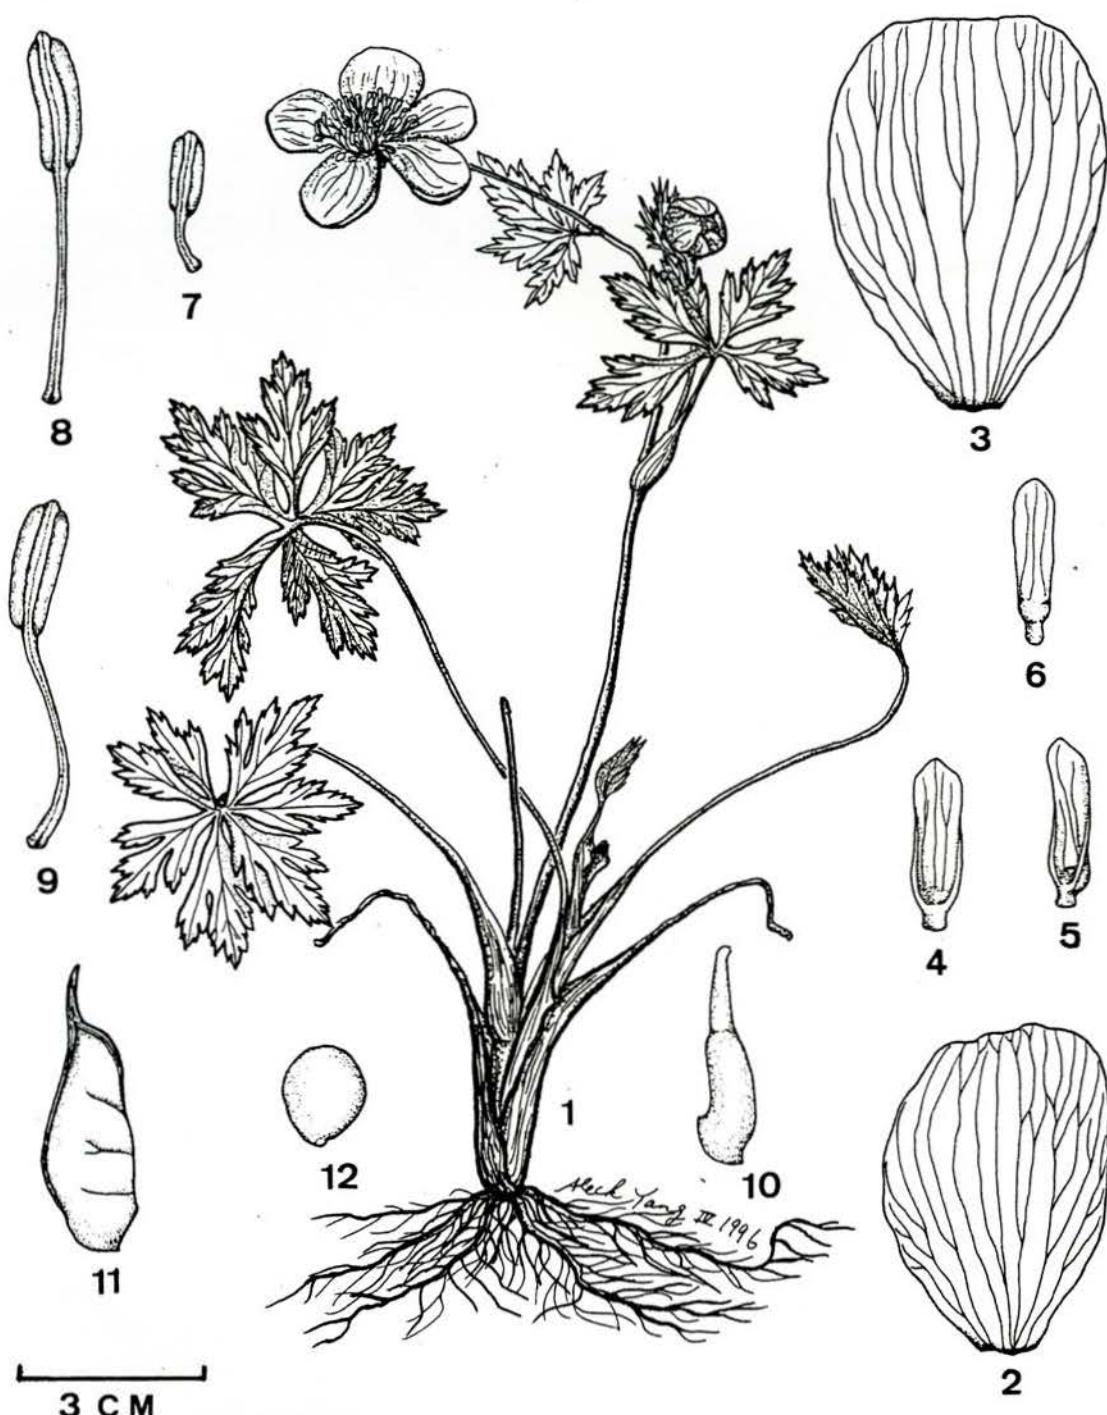

Fig. 27. *Trollius taihasenzanensis* Masamune. 1. Habit; 2. & 3. Sepals, 2, adaxial and 3, abaxial sides; 4.-6. Petals, 4 and 5, adaxial side; 6, abaxial side; 7.-9. Stamens; 10. Carpels; 11. Achene; 12. Seed.

Perennial erect herbs, stem glabrous, 20—35 cm tall. Leaves radical and cauline, palmately divided, 5—7-partite, 20—45 mm long, 40—65 mm wide; apex acute; base cordate; margin serrate; glabrous on both sides; petioles 6.0—18.0 cm long. Flowers solitary or sometimes in cyme, terminal, 27—40 mm diam., golden or yellowish-orange; pedicels 4.0—16.0 cm long. Sepals 5, ca. 12—19 mm long, 9—14 mm wide, broadly ellipsoid or ovoid. Petals 12, ca. 3—4 mm long, 0.5—1.0 mm wide, linear-ellipsoid, short-clawed, nectariferous at base. Stamens numerous, 6—12 mm long; anthers elliptic-linear, 2—3 mm long; connective shortly excurrent beyond pollen sacs; filaments narrowly linear. Carpels 6—15, ca. 6 mm long, glabrous. Follicles 8—14 mm long, glabrous, triangular-gibbous, keeled on ventral surface; styles persistent after anthesis, ca. 2 mm long. Seeds many, ca. 1.5 mm long, ellipsoid-globose, smooth.

Flowering May to July; fruiting June to August.

Endemic; narrowly distributed in northern part above 3000 m, on Tapachienshan and Chilaishan (Fig. 28).

**Hsinchu:** Chiensi: Mt. Tapachienshan, M.T. kao 8496 (TAI), S. Sasaki s.n. Jul 1932 (TAI). **Taichung:** Hoping: Mt. Chungyangchienshan, N. Fukuyama & Suzuki 15181(TAI). **Hualien:** Shiulin: Mt. Chilaishan, 3300 m, Yang & Sung 6078 (HAST, TNM, TAI).

## 臺灣毛茛科植物之新見(6)－臺灣毛茛科的一些屬

楊宗愈<sup>(1, 3)</sup>、黃增泉<sup>(2)</sup>

(收稿日期：1996年2月13日；接受日期：1996年3月9日)

### 摘要

本篇是有關臺灣產毛茛科 (Ranunculaceae) 植物一些屬的分類學之研究，計有烏頭屬 (*Aconitum* L.)、銀蓮花屬 (*Anemone* L.)、雞爪草屬 (*Calathodes* Hook.f. & Thomson)、黃連屬 (*Coptis* Salisb.)、人字果屬 (*Dichocarpum* W.T. Wang & Hsiao)、毛茛屬 (*Ranunculus* L.) 與金蓮花屬 (*Trollius* L.) 等七屬，共十九個分類群。文中對每一分類群皆有詳細描述，並附其檢索表及在臺之分布圖。

關鍵詞：烏頭屬，銀蓮花屬，雞爪草屬，黃連屬，人字果屬，毛茛屬，金蓮花屬，毛茛科，分類學，臺灣。
